2. Mount the QS4 control unit to the inside left panel and secure with velcro.
3. Connect the main connector of the Bazzaz fuel harness into the control unit.

11 > CHECK

1. In order to check that the system is installed correctly, download the Bazzaz Z-Fi Mapper software at bazzaz.net.
2. Plug the USB cable into the control unit and computer.
3. Locate and open the Z-Fi Mapper software.
4. Start the vehicle and check that the following inputs read correctly on the software.
 - RPM - Make sure that the RPM is reading near what the vehicle is idling at.
 - GPS - The vehicle should read neutral (or whichever gear it is in). For motorcycles that use a Gear Position Sensor, the bike does not need to be running to do this. For motorcycles that use a speed sensor, the wheel must be spinning to read gear properly. This can be checked on a dynamometer or by using a rear stand. Use caution when testing componentry.

Also use software to:

- Save and load new quickshift maps
- View diagnostics for troubleshooting
- Change quickshift settings

If any problem is found, please carefully follow through the installation steps again.
